Standpipe Management System

Avdata AUSTRALIA

Water is *valuable*

Australia is a dry country and water is a valuable and scarce resource. Managing the use of water at your standpipe can be expensive.

How Avdata can *help* to manage water use

We can help you with:

- equipment to control access to water standpipes
- regulating access to grey-water outlets
- reporting details of water use
- billing people for the water they use.

Setting *up*

Avdata supplies all of the purpose-built equipment you need to control access to your water, including the :

- electronic controller
- modem or network device
- electronic access 'keys'
- control panel

One control panel can regulate one or more outlets.

At remote locations, power can be supplied by solar panels, and communications can be via wireless (GSM) modem

Tailoring charges to your *standpipe*

You decide how much to charge for water usage at your standpipe. Charges can be varied as required.

The *advantages* for you

- We help you to recover costs by collecting a fee from people accessing water at your standpipe.

- You can control and monitor who has access to water at each location.

- Wastage is reduced and appropriate use of water can be enforced.

- You avoid overheads that are expensive but often hidden - like managing keys, coins, tokens, data entry, billing and receipting.

  Because there are no coins, the Standpipe Management System removes the temptation for theft and vandalism, reducing down-time and the costs of repair.

- Every month we send you just one payment - a major saving on administration.

- With your payment, we also send you a report detailing water usage in the past month by each key-holder.
